

Connecting Printo to RealSoft

The ways we can send drawing data into your RealSoft ERP

Prepared for: Coral Business Solutions | RealSoft ERP | A simple, non-technical guide

In one line: what Printo does

Printo reads your approved construction drawings using AI, automatically pulls out the title-block details (drawing number, project name, revision, sheet, scale, and more), checks them for mistakes, and then sends that clean data straight into RealSoft - **with no manual typing**.

The only open question is **how** the data travels from Printo into RealSoft. There are three practical ways to do this. This document explains each one in plain language so you can pick the one that suits RealSoft best.

The three ways to connect

Option A - Live API Link **RECOMMENDED**

What it is: Printo sends each drawing's data to RealSoft **instantly** over a secure internet link (an "API"), using a private key that RealSoft gives us.

How it feels	A drawing is processed and, seconds later, the record already exists in RealSoft. Fully automatic.
Good because	Real-time, no files to move by hand, and every send is logged so nothing gets lost.
Things to note	RealSoft needs to expose a web address (endpoint) that accepts the data.
What we need	A web address (base URL) and a security key from RealSoft / Coral.
Status	Already built in Printo - we only need the address and key to switch it on.

Option B - Excel / CSV File Import SIMPLE FALLBACK

What it is: Printo creates a RealSoft-ready spreadsheet (Excel or CSV) of the drawing data. That file is then loaded into RealSoft through RealData Hub - either by a person or on a schedule.

How it feels	Like handing RealSoft a perfectly formatted spreadsheet, ready to import in one click.
Good because	Very simple, no live connection required, and it uses RealData Hub which already exists.
Things to note	It works in batches, so it is not instant. The spreadsheet must match RealSoft's import template exactly.
What we need	The Excel / CSV import template (the exact column names) from RealSoft / Coral.
Status	Quick to add once we have the template.

Option C - Read-Back Check OPTIONAL / LATER

What it is: Printo can also **read** records back from RealSoft - for example, to confirm a drawing was saved, or to avoid creating the same record twice.

How it feels	A safety net that double-checks RealSoft after sending data.
Good because	Prevents duplicates and gives extra confidence the data landed correctly.
Things to note	This is a "nice to have" for later, not needed to go live.
What we need	Read access to RealSoft's Data Portal.
Status	Optional - can be added after the main connection works.

One method we will NOT use: automatic "push" alerts from RealSoft (webhooks / event callbacks). RealSoft does not offer these, so our design does not depend on them. No action needed from your side.

Side-by-side comparison

Method	Speed	Setup effort	Best for	Status in Printo
A. Live API Link	Instant (real-time)	Low - needs URL + key	Day-to-day automatic flow	Built - awaiting key

B. Excel / CSV Import	Batch (not instant)	Low - needs template	Simple start / offline fallback	Quick to add
C. Read-Back Check	On demand	Optional	Duplicate prevention later	Optional add-on

Our recommendation

Start with Option A (the Live API Link). It is real-time, fully automatic, and the code is already built in Printo - we only need a web address and a security key from your side. We suggest keeping **Option B (Excel / CSV)** ready as a simple fallback, and adding **Option C (Read-Back)** later for extra safety.

What we need from RealSoft / Coral to go live

- [**RealSoft web address (base URL)** for the test environment.
]
- [**Security key (API key / token)** so Printo can connect safely.
]
- [**Exact "import" address** (the endpoint that accepts new drawing records).
]
- [**The exact field names** RealSoft expects (the DrawingMaster columns), so the data matches perfectly.
]
- [**The Excel / CSV import template** - only if you prefer Option B.
]
- [**5-10 sample approved drawings** so we can test accuracy end-to-end.
]

Is it secure?

Yes. Every connection uses a private security key (a "Bearer token") that only RealSoft and Printo know. Until RealSoft provides the real key, Printo runs in a safe **simulation mode** - it prepares the exact data it would send, but does not send anything live. This lets us test everything safely before connecting to your real system.
